Sample Screen

KEYSTONE[®] 600N5 SOFTWARE

The Stanley Security Solutions Keystone[®] 600N5 key and core management software offers all of the same security, convenience, and functionality found in the original Keystone[®] 600 programs, but with the added ability to operate in a network configuration. Keystone[®] 600N5 will assist you with the tedious task of managing your key and core records in today's environment, in which multiple people in different locations may need to access the data simultaneously. The Keystone[®] 600N5 software is designed to operate over modern network environments, such as Windows[®] NT, XP, 2000 or 2003 servers. The Keystone[®] 600N5 includes special help screens that can be accessed whenever you need assistance. Complex commands and detailed menu trees are eliminated by the function key index at the bottom of each screen. Select the information tab desired and the appropriate screen is called up. Instructions and help screens are immediately available.

ADDITIONAL FEATURES

Buildings

- Support multiple facilities
- Displays people, keys and departments with access to a building
- Lists departmental access, designating the people, keys and keyrings that have access to that department
