Mechanical Keying System

OFFERED IN TWO KEYWAY SERIES

The patented keying system uses a patented Side Pin to ensure that cylinders and cores will only operate with the proper key. When locked, the Side Pin engages the slot in the core body and sleeve, thus preventing rotation unless the correct key is present. Once the proper key is inserted into the core, the Side Pin slides out to disengage from the body and sleeve, thus allowing rotation. The system is compatible with all of the supplier's existing BEST figure-8 lock housings, which eliminates the need and expense for new locks or the modification of existing locks. The system is offered in two series of keyways. MX8 Patented Keying System, Stanley Security Solutions (stanleysecuritysolutions.com) Circle No. 25 or visit securitysolutions.com/productinfo.
