Security and access control software from Stanley allows central management of disparate security functions

Best Access Systems, a division of Stanley Security Solutions, Inc., and a provider of access and security solutions, has announced the introduction of its B.A.S.I.S ET600, an integrated security and access control product. This software driven system offers end-users the critical elements of protecting people and assets.

The ET600 system communicates to a circuit board network and allows users to integrate and manage all of its physical security and access control resources via a single user interface and database.

According to the company, this functionality enables organizations to merge the often disparate and disconnected security tools and functions that typically exist within a building, business or facility. The ET600 system is comprised of a broad spectrum of security components that include access control, ID management, integrated digital video, visitor management and alarm monitoring all of which can now be consolidated using the ET600 system's single user interface.

The ET600 can be linked with other database servers within the enterprise including human resources, credential management, building process automation and remote administration in order to capture and reflect critical status updates in real time. This ultimately enables the end-user to deploy and execute a security and access control program in a unified and efficient manner that reflects the latest status and event updates.
