Electronic locking system

Written by SPT News

The IDH MAX 1300 lock is designed to replace reader devices, electrified strikes, door contacts and request-to-exit devices in cylindrical or mortise lock applications. It features an Intelligent System Controller (ISC), which is secured and out of site, embedded behind the escutcheon. Available with magnetic stripe or proximity card reader technology, the IDH MAX® 1300 lock integrates the reader technology into the lockset escutcheon. The proximity card reader can be HID or Motorola/Indala proximity card supported and compatible with Weigand, ABA and custom formatted proximity cards. It can be used in interior and exterior applications. All sensors are standard in the IDH MAX mortise locks, with the door contact, request-to-exit and latch status sensors positioned inside the lock case.
