### Safe Lock

*Remote access*

Sargent and Greenleaf's IP Series™, a user-friendly remote electronic safe lock manage-

ment system, is designed for any organization that depends on safe locks at dispersed locations. The system ensures the integrity of the existing program by connecting and operating within the user's existing LAN/WAN network, while offering data encryption for added protection. Authorized personnel can remotely program locks and manage user populations, such as entering and deleting users and changing user codes. In addition, users can pull audit trails and generate exception reports. *Sargent and Greenleaf.*
