STANLEY SECURITY SOLUTIONS INTRODUCES NEW WIRELESS ACCESS CONTROL TECHNOLOGY

Wireless Upgrade for BEST® Mortise and Cylindrical Locks Features Low Power Consumption and Online Diagnostics for Maintenance Needs

LAS VEGAS (ASIS Show) – September 24, 2007 – Stanley Security Solutions, Inc., a provider of access control and integrated security solutions, today introduced its new BEST® wireless lock technology for use in conjunction with the Stanley® NT500™ and B.A.S.I.S.® access control software.

This new wireless function enables the BEST® electro-mechanical locksets to have real-time communication with a host computer without the wiring or additional controllers that are normally required for hard-wired systems. No longer must a person either go to a device to download the audit trail or walk to the device to program personnel or time-schedule changes. BEST® wireless readers are battery-powered, stand-alone access control systems capable of real-time remote access control management.

This wireless technology enhancement features low power consumption, which enhances battery life, a critical factor in a wireless environment, enabling up to 100,000 transactions before the battery requires changing. The wireless upgrade for standard mortise and cylindrical locksets supports proximity, magnetic stripe and dual validation reader technologies.

Triple redundant storage of transactional data at the reader, the gateway and the central station database ensures that the door still functions since the system operates at all

times – even in the event of network or power failures. Redundant secure AES 128-bit encrypted communications offers the highest available security as defined by U.S. government standards. In addition, online real-time system diagnostics allows end users to conveniently know their maintenance needs without a site visit.

A retrofit kit is available for BEST® offline electronic lock customers seeking to integrate online wireless capabilities into existing security systems, converting their B.A.S.I.S.® system from an offline to an online system with minor alterations.

"We are extremely excited to be introducing wireless technology into our cylindrical and mortise lock products, and we expect customers to rave about this low-power, high security solution," said Stephanie Boyle, director, SMS product management, Stanley Security Solutions.

The wireless product will be rolled out over the next nine months, with the B.A.S.I.S.® version for mortise locks available in April 2008, and the cylindrical lockset version for the NT500™ Security Management System available in summer 2008.

About Stanley Security Solutions

Stanley Security Solutions, a business division of The Stanley Works, is a provider of access control and integrated security solutions for institutional, commercial and industrial businesses and organizations. With a strong emphasis on service, Stanley Security Solutions delivers a comprehensive suite of security products, software and integrated systems directly to end user customers. Stanley Security Solutions is committed to extending its position as a leading comprehensive resource for a broad and extensive array of solutions that span the entire security spectrum.
